the determination of sag and tension in transmission line spans and an estimate of the cost of a typical transmission line system Sag is defined as the different in level between points of supports and the lowest point on the conductor. Here AOB is the transmission line conductor. Two supports are at point A and at point B. AB is the horizontal line and from this horizontal line to point O, S is the sag when measured vertically.

the determination of sag and tension in transmission line spans and an estimate of the cost of a typical transmission line system The design length of a sag vertical curve is based on the head light sight distance, but the head light sight distance needs to be designed almost equal to the stopping sight distance because of safety criterion. Therefore, stopping sight distance values can be use for S value in general equation.
